

## HiPRwind High Power, High Reliability Off-shore Wind Technology

- **Project budget: 19.8 million €.**
- **End Users: Acciona, ABB, Narec**

HiPRwind (read “hyperwind”) is an EU project introducing a new cross-sectorial approach to the development of very large offshore wind turbines. Focused on floating systems, this project will develop and test new solutions for enabling

offshore wind technologies at an industrial scale. The project is designed with an “open architecture, shared access” approach in that the consortium of 19 partners will work together, in a

collaborative way, to develop enabling structural and component technology solutions for very large wind power installations in medium to deep waters.

A central outcome of HiPRwind is to deliver a fully functional floating wind turbine installation at approximately 1:10th scale of future commercial systems, deployed at real sea conditions. This research & testing facility, a world’s first, will be used to research new solutions and generate field data. The project will address critical issues of offshore wind technology such as the need for extreme reliability, remote maintenance and grid integration with particular emphasis on floating wind turbines, where economic and technical weight and size limitations of wind turbines and

support structures can be overcome. Innovative engineering methods will be applied to selected key development challenges such as rotor blade designs, structural health monitoring systems, reliable power electronics and control systems. Built-in active control features will reduce the dynamic loads on the floater in order to save weight and cost compared to existing designs. HiPRWind will develop and test novel, cost effective approaches to floating offshore wind turbines at a lower 1-MW scale.

Thereby, HiPRwind will significantly reduce the risks and costs of commercialising deep water wind technology. The HiPRwind project will make use of existing test locations which offer a favourable permitting situation and infrastructure such as grid connection and monitoring facilities already in place.

In an early stage of the project, the floating support structure and its moorings system will be designed; and a full demonstrator unit will be assembled at port facilities and installed at the offshore test site. Critical aspects of the floating wind turbine will be investigated, such as the structure and its system dynamics, the controller, condition and structural health monitoring systems, and the rotor based on innovative blade designs and features. High reliability power electronics will be designed, assembled and tested in the lab at a multi-MW scale.

The full impact of the HiPRwind project will be ensured by the strong and close collaboration of participating best-in-class industrial and R&D players in the maritime and wind energy sector with a strong background on successful industrial development in harsh environments.
